Attribute selectors in real stylesheets

Framework utilities

Every column, whether its col- class comes first or later, has a blue bar and a light blue background, except the half-width ones, which are green. The email link is purple, the phone link orange, the link opening a new window italic, and the PDF link, first in its paragraph, bold.

col-12: first class

card col-md-4: a later class

col-6: half width

colour: no column class

A multilingual article

French text is blue, the German paragraph red. Bold text directly inside English is underlined. The first paragraph of the quote that names its source is italic. Emphasis inside anything marked with a language is bold.

An English paragraph with **underlined bold** and ***bold emphasis***.

Un paragraphe français, avec un span qui en hérite.

Ein deutscher Absatz.

A paragraph with no language of its own, sauf ici, and *plain emphasis*.

> *The first paragraph of a sourced quote.*
>
> Its second paragraph.

An invoice

The dark theme gives the header row white text on dark grey. The void row is grey and struck through. The overdue row has a red bar at its left. Amounts are right-aligned, and the paid amount is green and bold.

Invoice	Customer	Amount
INV-001	Acme	**480.00**
~~INV-002~~	~~Initech~~	~~190.00~~
INV-003	Globex	102.00

Competing rules

Attribute selectors weigh as much as classes. Each paragraph says the colour it should be.

Orange: .pricing > p[data-plan].

Purple: .pricing > p.featured weighs the same as .pricing > p[data-plan] and comes later.

Blue: two attributes outweigh one.

Green: #plans > [data-plan="team"] outweighs .pricing > p[data-plan="team"].featured.
