autoPadding with a border-radius

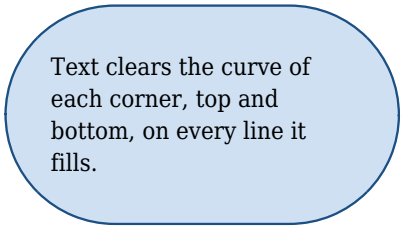

A block shorter than its two radii has its corners drawn smaller to fit, as CSS does, but is padded for the full radius.

Percentages, on a block 40 mm wide

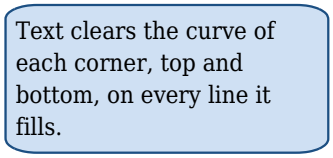

50%: the text starts on the curve, 5.9 mm in from the left and down from the top, the same on the right and bottom.

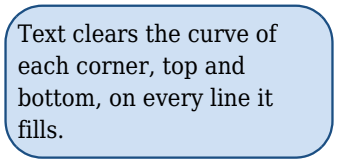

20mm, the length 50% comes to: the text sits where it does in the box above.

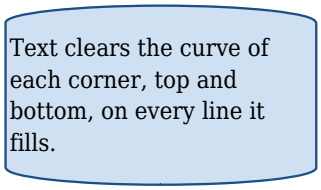

10%: the text is 1.2 mm in from the left and down from the top, just clear of the small corner.

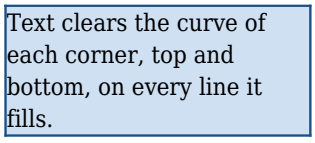

5mm: the text is 1.5 mm in from each side.

50% / 10%, a flat corner: padded mostly down, 0.4 mm in from the left and 3.2 mm down from the top.

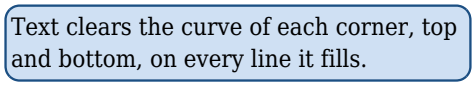

No radius: no padding, the text against the top left of the box.

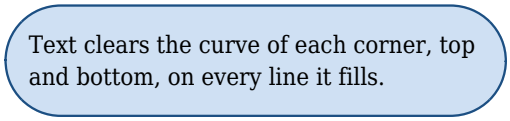

Radii from small to large, on a block 60 mm wide

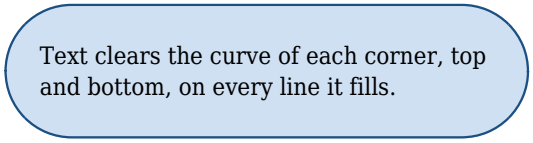

2mm: the text is 0.6 mm in from each side.

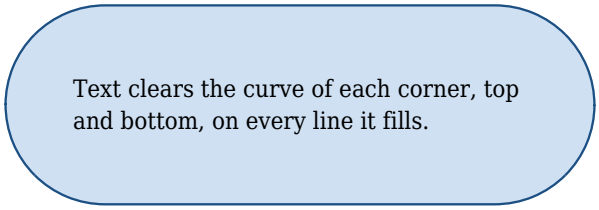

10mm: 2.9 mm in from each side.

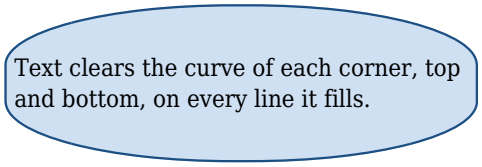

15mm: 4.4 mm in from each side.

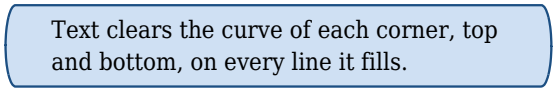

30mm, half the width: 8.8 mm in from each side.

30mm / 8mm, wide and flat: 1.0 mm in from the left and right, 5.9 mm in from the top and bottom.

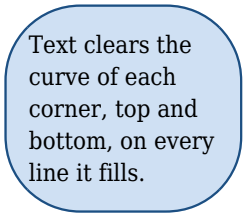

8mm / 30mm, narrow and tall: 5.9 mm in from the left and right, 1.0 mm in from the top and bottom.

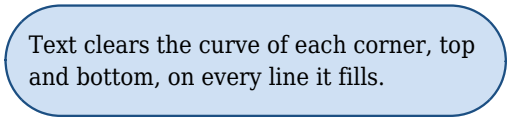

Blocks of different widths

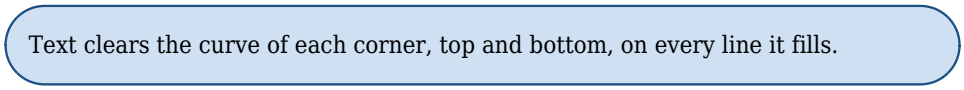

10mm on a block 25 mm wide: 2.9 mm in from each side, as on any width.

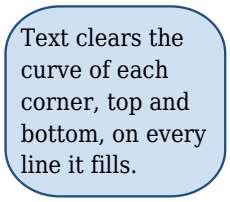

10mm on a block 60 mm wide: the same 2.9 mm.

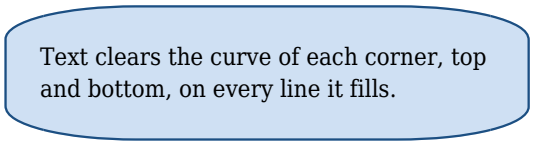

10mm on a block 120 mm wide: the same 2.9 mm.

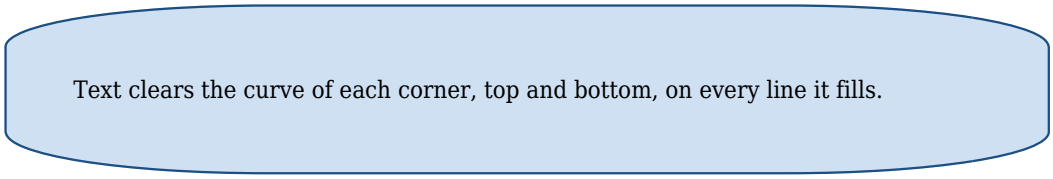

25% on a block 25 mm wide, a radius of 6.25 mm: 1.8 mm in from each side.

25% on a block 60 mm wide, 15 mm: 4.4 mm in from each side.

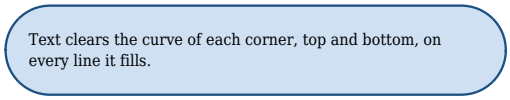

25% on a block 120 mm wide, 30 mm: 8.8 mm in from each side.

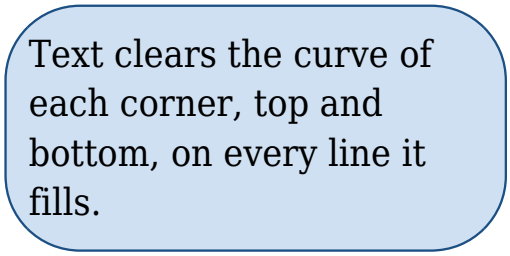

Font sizes, on a block 60 mm wide

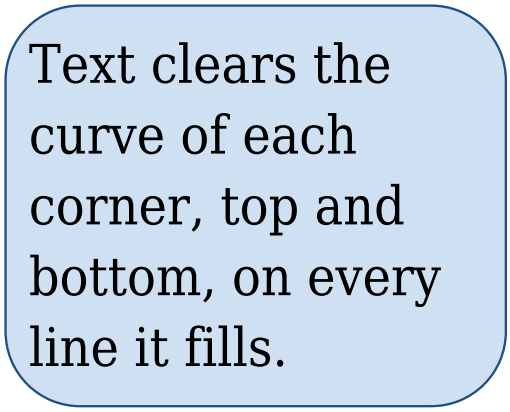

10mm at 6pt: 2.9 mm in from each side; the padding does not depend on the text.

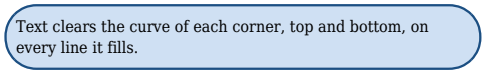

10mm at 14pt: the same 2.9 mm, the larger lines still clear of the curve.

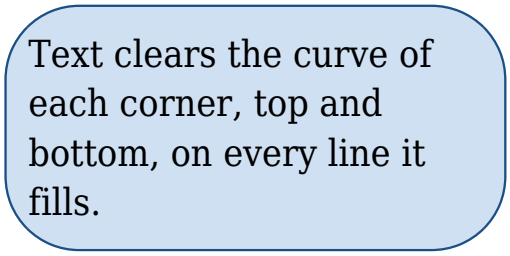

10mm at 20pt: the same 2.9 mm.

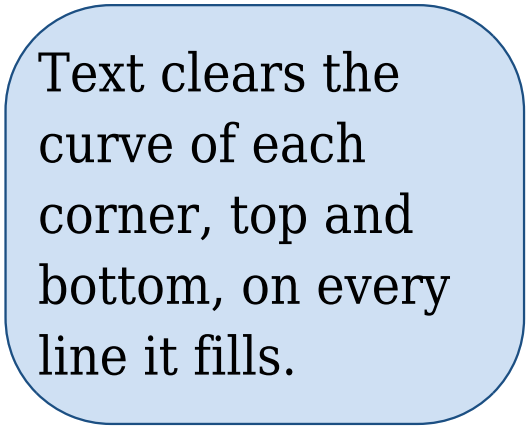

2em at 6pt, a radius of 4.2 mm: 1.2 mm in from each side.

2em at 14pt, 9.9 mm: 2.9 mm in from each side.

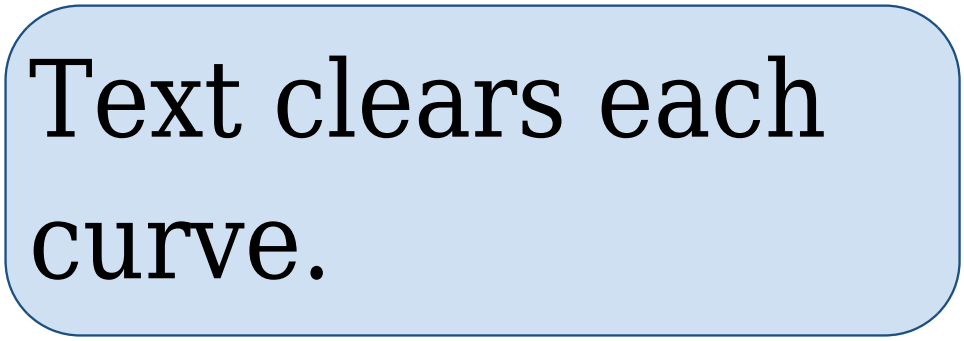

2em at 20pt, 14.1 mm: 4.1 mm in from each side.

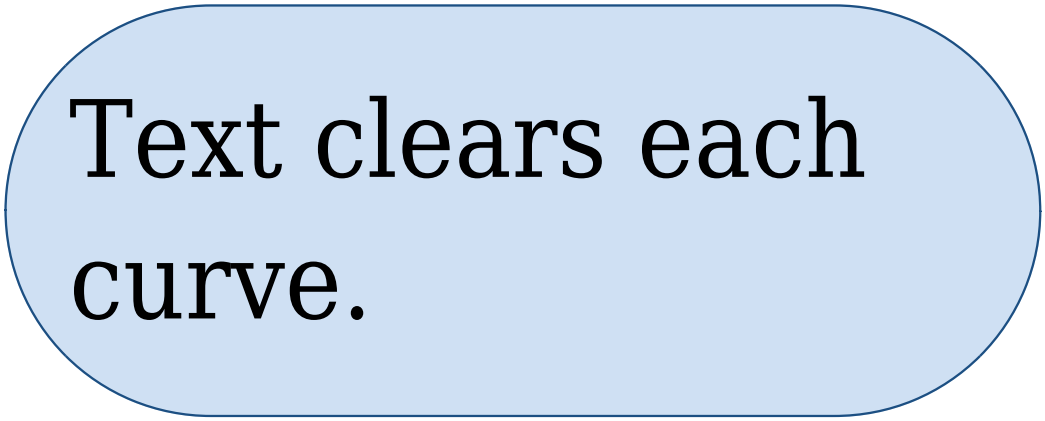

40pt text, on a block 120 mm wide

10mm at 40pt: the same 2.9 mm in from each side as at any size.

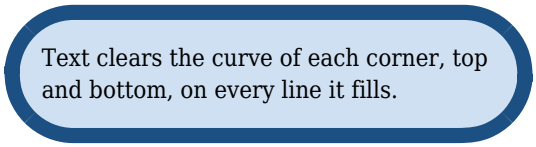

2em at 40pt, a radius of 28.2 mm: 8.3 mm in from each side.

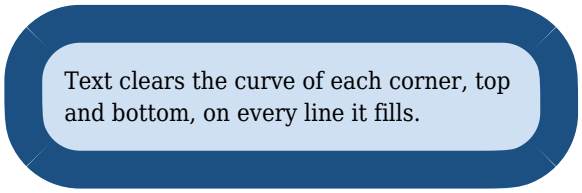

Borders and padding, a 10mm radius on a block 60 mm wide

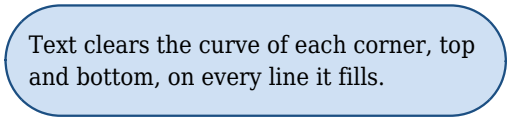

A 2 mm border: the text is 2.9 mm inside the border, as with a thin one. The padding is measured from the outside of the border, so the text sits further in than the curve needs.

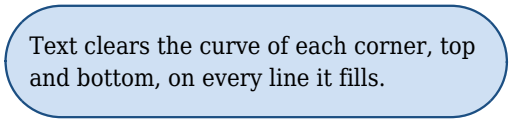

A 5 mm border: still 2.9 mm inside the border, well clear of the curve.

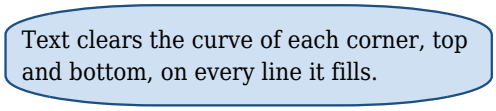

padding: 1mm, short of the curve: raised to 2.9 mm on each side.

padding: 3mm, already clear of the curve: kept at 3 mm.

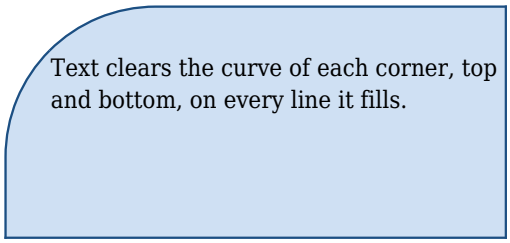

20mm / 4mm with padding: 2mm: 2 mm across is clear, so only the top and bottom are raised, to 2.3 mm.

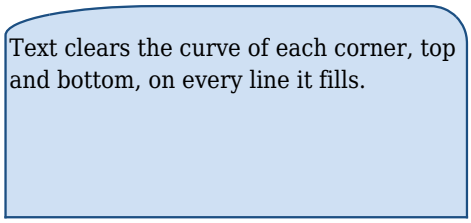

Mixed corners, on a block 60 mm wide and 25 mm tall

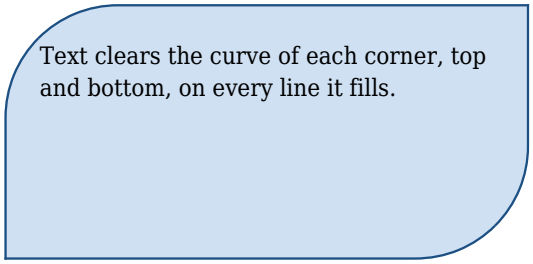

Only the top left rounded, 20mm: the text is 5.9 mm in from the left and down from the top, with no padding on the right or bottom.

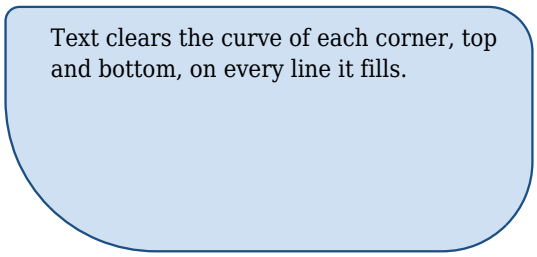

Top left 20mm / 4mm, top right 5mm: 3.2 mm down from the top, 0.4 mm in from the left; the right corner reuses that top padding and only needs 0.3 mm in from the right.

Top left and bottom right 15mm: 4.4 mm in from every side, as each side touches one rounded corner.

2mm, 6mm, 12mm and 20mm clockwise from the top left: 1.8 mm down from the top, 3.5 mm in from the right, 5.9 mm in from the bottom and left.

Only the top corners, 30mm / 8mm: 5.9 mm down from the top and 1.0 mm in from each side, with no padding at the bottom.
