Chained context positioning

A mark is placed by whichever subtable of a lookup matches first, and by that one only. Each pair below asks for the same mark twice: once where two subtables of the lookup match the glyph, and once where one does. The mark has to land in the same place both times.

Taamey David CLM: the Holam under an Alef

Alef, Holam, Qarney Para, Munah - two subtables of the mark lookup match

Alef, Holam, Munah - one does, and places the Holam where it belongs

Alef, Holam, Qarney Para - the marks without the Munah that closes the chain

Mem, Holam, Qarney Para, Munah - the same three marks on another letter

Padauk Book: the Dot Below under a Ka

Ka, Dot Below, Asat - two subtables of the mark lookup match

Ka, Dot Below - one does, and places the dot where it belongs

Nga, Dot Below, Asat - the same marks on a letter the chain does not match twice
