An id written with classes

On their own

.note and p#id make each paragraph red, and the rule naming the id with the class is applied after them.

p#one.note: green and bold

p.note#two, the class written first: blue and italic

#three.note, with no tag: black on yellow

p.wide.note#four, two classes: green and bold

In descendant rules

div.chain p#five.note: the paragraph is blue and bold, not red.

A paragraph named by id and class inside div.chain

div#outer.frame p: the paragraph is green and italic.

A paragraph inside the div named by id and class

Table cells

table.cells td#cell.hit: only the middle cell has a blue background. td#host.box span: the words in the last cell are green and bold.

td#miss.hit	td#cell.hit	plain, then **green words**

More classes over a tag

#six.x.y names more classes than p#six.x, so it is applied later: the paragraph is green and bold, not red.

A paragraph with two classes
