Exif Orientation of a greyscale JPEG

The sample is a one-channel JPEG stored portrait, a gradient that runs from dark down its left side to light down its right, with the Exif `Orientation` tag saying it is a quarter turn clockwise from the right way up. GD decodes it to three channels and cannot write it back as one, so the corrected image is embedded as the grey samples GD decoded, deflated, rather than re-encoded as a colour JPEG.

Both samples below have to be drawn landscape, twice as wide as they are tall, dark along the top and light along the bottom, in a neutral grey with no colour cast. The first is given a width and no height, and the second a height and no width, so the missing dimension comes off the corrected image both ways round.

width: 40mm	height: 20mm
