Descendant rules through inline ancestors in real stylesheets

A CMS article

The first paragraph's drop cap is large and green. Links are blue, and strong text in a link is purple. Emphasis inside the accent span is red and bold. Code inside the highlight is brown on yellow. Small text in the acronym is grey, and small text outside it black. In the citation, the span is grey and upright.

This opening paragraph starts with a drop cap, and has a link with **strong text** and **strong text** outside the link.

A sentence with an ***accented*** phrase, and *plain emphasis* outside it.

Run the `build` command before `deploy`.

The **API** (interface) has small print too.

> A quoted line.
>
> *A Writer,* in a book

An invoice

Each status badge is white on green, or on red when overdue. In the note, the small text is grey and italic and the bold text red. The currency is small and grey beside each amount. The bold text in a span in the first column is blue. The nested list in the last row has no space above or below it.

Item	Status	Amount
INV-001 Consulting	**PAID**	AUD 480.00
INV-002 Design	**OVERDUE** **Reminder sent.** *Second notice.*	AUD 190.00
• Hosting - Twelve months - Two domains • Support		

Competing rules

The rules compete by specificity, then by source order, whether a block or an inline element is the ancestor they match through. Each bold word says the colour it should be.

Green: .pricing b, through the div.

Orange: .pricing p .deal > b outweighs .pricing .deal b, which only the span matches.

Blue: .pricing .plain b, which only the span matches, outweighs .pricing b.
