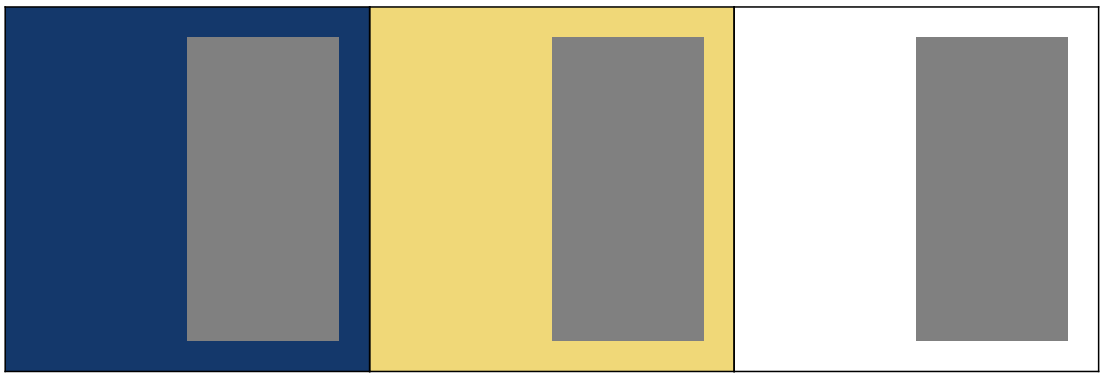
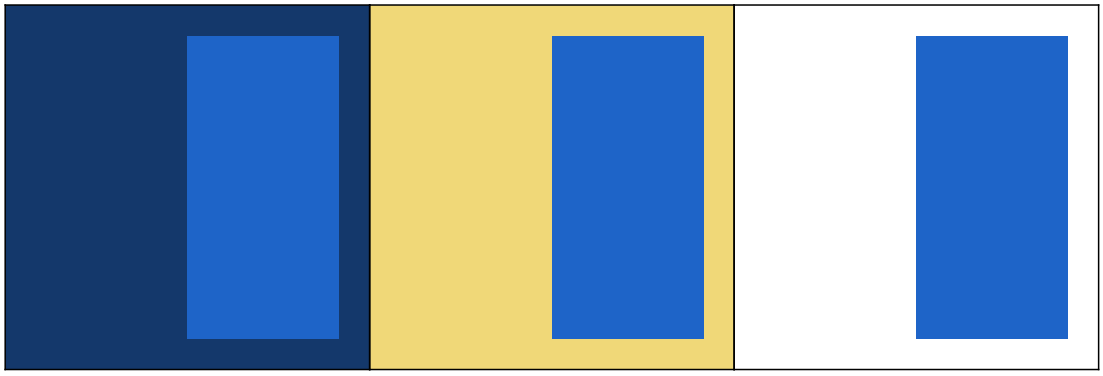
PNG tRNS transparency

Each sample is eight pixels square. The left half is the one colour the image's `tRNS` chunk names as transparent, and the right half is an opaque colour the other sample does not use. So over every plate the left half has to be the plate showing through, and the right half has to be the sample's own colour - grey for the greyscale image, blue for the truecolour one - whatever the plate behind it.

Greyscale, colour type 0

One transparent sample, black. The half that stays is mid grey.



Truecolour, colour type 2


Three transparent samples, red. The half that stays is blue.
