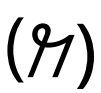
mPDF

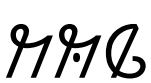
A script added after Unicode 6.1

The font files every lookup it has under its own script tag, wcho, and carries no DFLT script at all. Compare the opening bracket of the first sample with the one of the second: the first is the bracket the font draws for Wancho, which it can only be asked for by name.

Bracketed Wancho - the Wancho opening bracket



The brackets alone - the Latin ones, the form the run was given

()


Three letters - spaced by the font rather than by their own widths
