The standard cascade

#id beats p.class: the line is green.

An id against a tag with a class

#id beats div.class div p: the line is green.

An id against a descendant rule

.class.class beats body p.class: the line is green.

Two classes against body and a tag with a class

.class p beats div div div p, although the divs are nearer: the line is green.

A class ancestor against three tag ancestors

.c5a is written after .c5b, so it wins whichever order the classes are in: both lines are green.

Classes a then b
Classes b then a

.c6a, then .c6b, then .c6a again: the second .c6a comes last, and the line is green.

A selector written twice

A rule in a later style block beats one as heavy in an earlier block: the line is green.

A rule in a later stylesheet

:where() counts nothing, so div.class p beats :where(#id) p: the line is green.

:where() against a class

The inline style beats #id: the line is green.

Inline style against an id

ul.class beats the default stylesheet's ul ul, which counts as the built-in stylesheet's: the nested list keeps the 4mm gap below it, so "Outer two" is well below "Inner two".

- Outer one
  - Inner one
  - Inner two
- Outer two

<hr color> beats the grey of the built-in defaults: the rule is green.

---

td#id beats table.class tr td: the middle cell has a thick green border, drawn over its neighbours' thin red ones.

Left	Middle	Right
