Table column widths

table-layout: fixed, width 100mm, a first cell of 20mm holding one long word: the first column 20mm with the word broken over several lines, the second 80mm.

xxxxxxxxxxxxx xxxxxxxxxxxxx xxxxxxxxxxxxx xxxxxxxxxxxxx xxxxxxxx	b

The same table laid out by its content (no table-layout): the first column widens for the word, so the table runs past the end of the bar.

<col style="width: 80mm"><col style="width: 20mm">: columns of 80mm and 20mm.

a	b
c	d

<colgroup> holding <col width="80mm"><col width="20mm">: columns of 80mm and 20mm.

a	b

<col span="2" width="30mm"><col width="40mm">: columns of 30, 30 and 40mm.

a	b	c

<colgroup span="3" width="25mm"> with no col in it and its end tag left out: three columns of 25mm.

a	b	c

Columns of 30 and 50mm under a first row whose one cell spans both, then a row with a cell in each.

a cell spanning both columns	
a	b

table-layout: fixed, width 100mm, <col width="40mm"> and a first row asking for 70mm for that column: the col wins; the other two columns share the 60mm left, 30mm each.

a	b	c
d	e	f

table-layout: fixed, width 100mm, a first row of 10% and 40%: columns of 10, 40 and 50mm.

a	b	c

table-layout: fixed, width 100mm, no widths and a long word in each cell: four columns of 25mm, each word broken.
