mPDF

background-size

cover

The image is scaled until it fills the box in both directions, keeping its aspect ratio, so whichever side runs out first is the one that ends up exactly the size of the box.

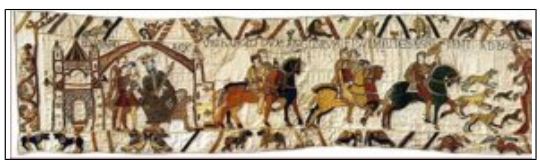

contain

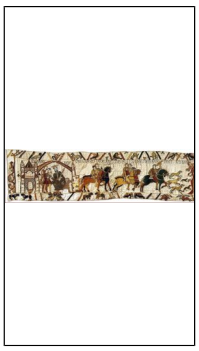

The mirror image of cover: the image is scaled until it fits inside the box, so whichever side reaches the edge first is the one that ends up exactly the size of the box.

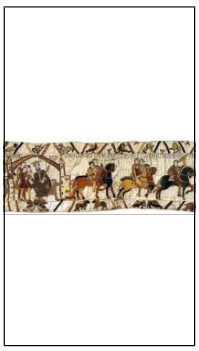

Lengths and percentages

100% 100% stretches the image to fill the first box. In the second box the image is 20mm wide, a little over a quarter of the box, and in the third it is 10mm tall, under a quarter of the box.

In a footer

The footer scales its backgrounds through a second copy of the same code.
