Exif Orientation

Every sample below holds the same picture, stored a different way up, with the Exif `Orientation` tag that says which. With `useImageExifOrientation` on, all eight have to be drawn the same way up as each other and as the browser draws them: twice as wide as they are tall, red top left, green top right, blue bottom right, yellow bottom left.

The box each is drawn in has to turn with it. Every sample is given a width of 40mm and no height, so the height comes off the corrected image, and a sample that was not corrected would be drawn twice as tall as the others rather than half as tall.

1		**2**	3		**4**	5		**6**	7		**8**	
An image with no Exif at all

Nothing to correct, so it is embedded exactly as it was stored.
