Percentages on an image in a table cell, at 300dpi

img_dpi is 300, so the 567px tiger is 48mm when given no width, and the 292px tapestry 24.7mm. Each table has three 60mm columns unless it says otherwise.

max-width narrows a picture, and never widens it

 max-width: 100% (48mm)	 max-width: 50% (30mm)	 min-width: 100% (60mm)

image-resolution overrides the document's DPI

 72dpi, max-width: 100% (200mm, capped to 60mm)	 96dpi, max-width: 100% (77.3mm, capped to 60mm)	 from-image, the file's own 300dpi (24.7mm)

An auto-width column takes the picture's own width

The table is given no width. The picture's column is 24.7mm and the picture given width: 100% fills it.

auto	

In a table too wide for its page

Long unbreakable words in five columns. The picture with max-width: 100% keeps its 24.7mm and is shrunk with the table.
