An nth-child argument and what follows it

td:nth-child(2):not(.x) names only second cells without the class x, and every second cell has it: no cell is red.

R1 C1	R1 C2 (x)	R1 C3
R2 C1	R2 C2 (x)	R2 C3
R3 C1	R3 C2 (x)	R3 C3

td:nth-child(2):nth-child(odd) names a cell that is both second and odd: no cell is red.

R1 C1	R1 C2 (x)	R1 C3
R2 C1	R2 C2 (x)	R2 C3
R3 C1	R3 C2 (x)	R3 C3

td:nth-child(2 of .x) names the second cell with the class x, and each row has only one: no cell is red.

R1 C1	R1 C2 (x)	R1 C3
R2 C1	R2 C2 (x)	R2 C3
R3 C1	R3 C2 (x)	R3 C3

tr:nth-child(2) td:hover has a part that never matches in a PDF, so not even the second row is shaded: no cell is red.

R1 C1	R1 C2 (x)	R1 C3
R2 C1	R2 C2 (x)	R2 C3
R3 C1	R3 C2 (x)	R3 C3
