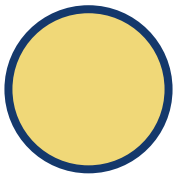
mPDF

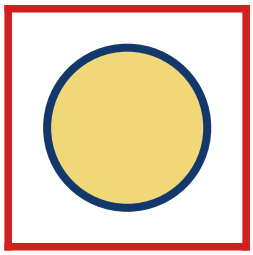
class on an embedded SVG

An embedded SVG is written out to a file and drawn as an image. The class it was given comes with it, so these rules reach the picture.

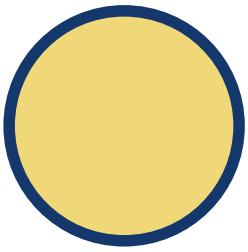
No class - drawn at the size the SVG asks for

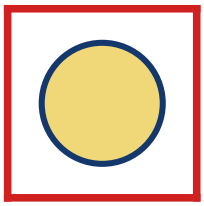


class="framed" - a border and padding around it



class="wide" - a width



class='narrow' - a width, in a single-quoted attribute


class="narrow spaced framed" - three of them at once
