## A zero-width space in MultiCell() with a Unicode font

Each row below writes the same words three times with MultiCell(), in DejaVu Sans, in boxes 40mm wide. On the left they run together with nothing between them, so the only place a line can end is wherever the box runs out, in the middle of a word. In the middle they are joined by zero-width spaces (U+200B), and on the right by ordinary spaces. The middle box has to break at the same places as the right one and keep every word whole, while drawing nothing between the words.

### Left to right

### Written other ways

WriteText(), WriteCell(), AutosizeText(), the shaded box, SVG text, the text around the circle and the textarea each hold a zero-width space between two halves, and draw nothing between them. The textarea draws in DejaVu Sans Mono, which has no glyph for U+200B and would draw a box for it. The Hebrew WriteText() on the right reads שלום then עולם from the right, in the order it was written.
